

Medicare-Medicaid Alignment Initiative (MMAI) Algorithm Summary:

The ICEB uses an algorithm to select a Plan and PCP for members who do not make an active Plan and PCP choice during their 60 day voluntary enrollment period. HFS encourages clients to make an active choice because they know their needs best. The algorithm considers the following factors to try to determine the best-fit Plan and PCP for an individual:

1. Current Medicare Advantage plan (If the client's current Medicare Advantage plan's parent company offers an MMAI plan as well, the client will be transitioned to the parent company's MMAI product.)
2. The Recipient's most recent/prior MMAI plan enrollment
3. The Recipient's most recent/prior HealthChoice IL plan enrollment
4. Recipient's current nursing facility
5. Recipient Claims History
6. Geomapping
